SKILLS

- Programming Languages: Python
- Frameworks: Flask
- ORM: Peewee
- Databases: SQLite, MongoDB
- Problem Solving and Debugging

EDUCATION

High School Diploma

PROFESSIONAL SUMMARY

Enthusiastic and self-motivated 17-year-old web developer with decent knowledge of Python, Peewee, and Flask. Ready to contribute my skills and passion for web development to a dynamic team and learn from experienced professionals.

PROJECTS

Throughout these projects, my responsibilities included gathering service requirements, crafting service designs, and creating databases if necessary. I also took charge of the development and testing.

- **Project [Fooder](#)**

A website that lets you plan your weekly menu by selecting dishes from a database. You can also review past menus, include ingredients for each dish, and generate a shopping list based on those ingredients.

- **Project [Payments](#)**

An API using which partners (using a special token) can check their payment history, input new payments with customized rates and view their exclusive rates.

- **Project [Gamesscore](#)**

A website that serves as a platform for users to track the games they are currently playing, those they have played, and those they want to play. One unique feature of this platform is a personalized rating system, where users can define their own scale and give names to each degree of the scale.

These projects are demonstrating my ability to create functional web applications using Flask and Peewee and my ability to apply my knowledge to practical situations. Also they have allowed me to experiment with solutions and deepen my understanding of web development principles
