## SKILLS

- Programming Languages: Python
- Frameworks: Flask
- ORM: Peewee
- Databases: SQLite, MongoDB
- Problem Solving and Debugging

## EDUCATION

### High School Diploma

## PROFESSIONAL SUMMARY

Enthusiastic and self-motivated 17-year-old aspiring web developer with decent knowledge of Python, Peewee, and Flask. Ready to contribute my skills and passion for web development to a dynamic team and learn from experienced professionals.

## PROJECTS

In all of these projects my role was to collect service's requirements, then doing service's design and designing database if needed. Development and testing was also done by me.

- **Project [Fooder](#)**

A website that allows you to construct a menu for a week from dishes stored in a database. You can also view previous menus, add ingredients for each dish, and generate a shopping list based on those ingredients.

- **Project [Payments](#)**

A website that enables partners, using specified tokens, to access their payment history, add new payments with a unique rate to their partners, and view their special rates.

- **Project [MyApi](#)**

A website that checks if you have a valid token and, if so, allows you to see the amount of your currency in hrn.

These projects are demonstrating my ability to create functional web applications using Flask and Peewee and my ability to apply my knowledge to practical situations. Also they have allowed me to experiment with solutions and deepen my understanding of web development principles. In addition these projects have not only sharpened my problem-solving skills and coding proficiency but have also improved my ability to work independently.
